Welcome to the Course

Mastering Keycloak for Real-World Applications

Meet Your Instructor

Hi, I'm Ajaz

I'm a Full Stack Developer and DevOps Engineer working in a product-based company. Over the past few years, I've worked across frontend, backend, and cloud infrastructure.

I deal with real-world systems, deployments, and production challenges on a daily basis. My goal here is to bridge the gap between abstract security theory and what actually happens when integrating auth in production environments.

My Engineering Journey

Frontend

Started my engineering journey building user interfaces and logic using Angular.

Backend

Transitioned into building robust APIs and business logic using Spring Boot.

Infrastructure

Expanded into cloud, containerization, and setting up deployment pipelines.

Current Role

Architecting reliable, scalable, and secure real-world systems daily.

My Daily Arsenal

Cloud & Infra

Leveraging AWS for scalable cloud infrastructure and managing it systematically using Terraform for Infrastructure as Code (IaC).

Containers

Building and containerizing applications with Docker, ensuring environments are consistent from development to production.

Observability

Ensuring systems are reliable, healthy, and scalable by implementing deep monitoring using Prometheus and Grafana.

The Course Philosophy

Typical Courses

A lot of security courses out there focus heavily on theory or isolated authentication concepts.

But in real jobs, systems don't work in isolation. You need to understand how identity management connects across your entire tech stack.

This Course

This course is not just theory-based. Everything I'm going to teach you comes from actual hands-on, production experience.

We'll build things step by step—from scratch—to see exactly how Keycloak integrates with frontend apps and backend APIs.

Course Focus

Keycloak Setup: Deploy and configure Keycloak from scratch for real-world use cases.

Frontend Security: Secure modern web applications and understand essential authentication flows.

Backend Protection: Protect your APIs and microservices using robust token validation and authorization logic.

Real-world Configs: Implement practical solutions like Single Sign-On (SSO) and advanced realm settings.

Production Practices: Understand how identity management behaves in actual deployment scenarios.

Is This Course For You?

- **Developers** who want to secure their applications seamlessly without reinventing the wheel.
- **Engineers** looking to implement robust Identity and Access Management (IAM) in modern architectures.
- **Action-Takers** who are tired of just watching theory tutorials and want to build real, secure projects.

Even if you're starting from scratch, I'll make sure everything is explained in a simple, practical way.

Let's Get Started

Let’s build secure applications together.
